Sources for the squad AI pilot case study

Milan Khanal, October 2026. Every figure in the case study and playbook, where it comes from, and what it does and doesn't show. Checked at the publisher's own page or report unless noted.

Source	Publisher and date	What it found	Limits
Future of Work Trends 2026	Accenture, October 2026	62% of executives expect AI to substantially or completely transform their core business model within three years; 15% are redesigning their end-to-end processes with AI at the core (p.16). Only 20% of employees strongly agree they are active co-creators in how AI changes their work (p.25).	Survey and interview based; sample sizes vary by figure.
The state of AI in 2025	McKinsey, November 2025	Companies getting the most value from AI (about 6% of respondents: 5% or more of EBIT from AI and "significant" value) are nearly three times as likely to have fundamentally redesigned individual workflows, and three times more likely to strongly agree that senior leaders own and commit to their AI initiatives.	Self-reported; 1,993 participants in 105 nations, fielded June to July 2025.
The state of AI: How organizations are rewiring to capture value	McKinsey, March 2025	CEO oversight of AI governance is one element most correlated with self-reported bottom-line impact; 21% of respondents using gen AI say their organizations have fundamentally redesigned some workflows.	Self-reported; 1,491 participants, fielded July 2024.
AI at Work 2025	BCG, June 2025	The share of employees who feel positive about generative AI rises from 15% to 55% with strong leadership support; frontline regular use has stalled at 51%.	More than 10,600 respondents in 11 countries.
Measuring the Impact of Early-2025 AI on Experienced Open-Source Developer Productivity	METR, July 2025	Experienced developers took 19% longer with AI tools while believing they were 20% faster.	16 developers, 246 tasks. A February 2026 follow-up (57 developers, 800+ tasks) pointed to a speedup, but METR calls that signal unreliable because of how developers were selected and how time was measured.
The AI Productivity Paradox	Faros AI, July 2025 (data as of June 2025)	Teams with high AI adoption completed 21% more tasks and merged 98% more pull requests, while pull request review time rose 91%.	Vendor telemetry from more than 10,000 developers across 1,255 teams.

Source	Publisher and date	What it found	Limits
AI-Driven Development Life Cycle	AWS DevOps Blog, July 2025	Defines AI-DLC: AI plans and asks clarifying questions, people validate before it builds; "Mob Elaboration" for turning intent into stories; short "bolts" in place of sprints.	A vendor method description, not a study.
Open-sourcing adaptive workflows for AI-DLC	AWS DevOps Blog, November 2025	"Human approvals are embedded at every decision gate," logged for audit.	A vendor method description.
Understanding spec-driven development	Birgitta Böckeler, martinfowler.com, October 2025	Compares spec-first, spec-anchored and spec-as-source tools; warns specs can be heavy for small work.	Practitioner review of tools.
Spec-driven development (Technology Radar)	Thoughtworks, November 2025	Placed at "Assess"; warns some tools generate lengthy specs that are hard to review.	Expert opinion.
State of AI-assisted Software Development	DORA (Google Cloud), September 2025	AI amplifies a team's existing strengths and weaknesses; working in small batches matters more.	Nearly 5,000 respondents.
Model Bulletin on the Use of AI Systems by Insurers	NAIC, December 2023	In adopting states, insurers using AI systems in decisions about consumers need a written AI program, governance and oversight of vendors. Adopted in 24 jurisdictions by March 2025 (Quarles, April 2025).	Applies to AI used in insurance decisions, not to coding tools directly.

The pilot design, its measures and its limits are proposals, not results. No figure here describes a pilot Milan has run.
